Abstract

The presentation has the focus on new logistic approaches in the automation process to increase the productivity and the quality level in glass processing plants.

- Evolution and steps of glass processing from a semi-automatic level to a full automated level
- Quality management and optimization
- Particular requirements of different market segments, in particular the insulated glass production (float, Low E, laminated and tempered glass)

This presentation will describe the different logistic units and their deployment according the conditions described above, with a focus on sorting and feeding systems as key components in the glass flow management.
